

Speeding up MATLAB Applications

Sean de Wolski
Application Engineer

Non-rigid Displacement Vector Fields

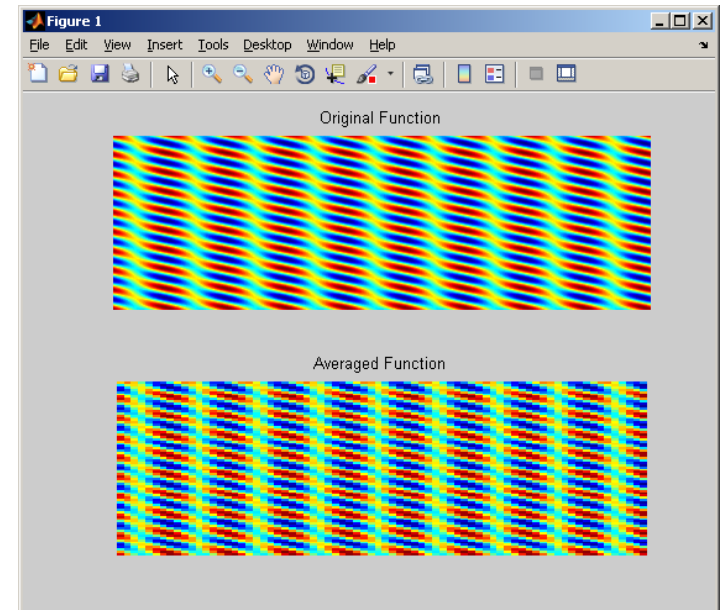

Agenda

- Leveraging the power of vector and matrix operations
- Addressing bottlenecks
- Generating and incorporating C code
- Utilizing additional processing power
- Summary

Example: Block Processing Images

- Evaluate function at grid points
- Reevaluate function over larger blocks
- Compare the results
- Evaluate code performance

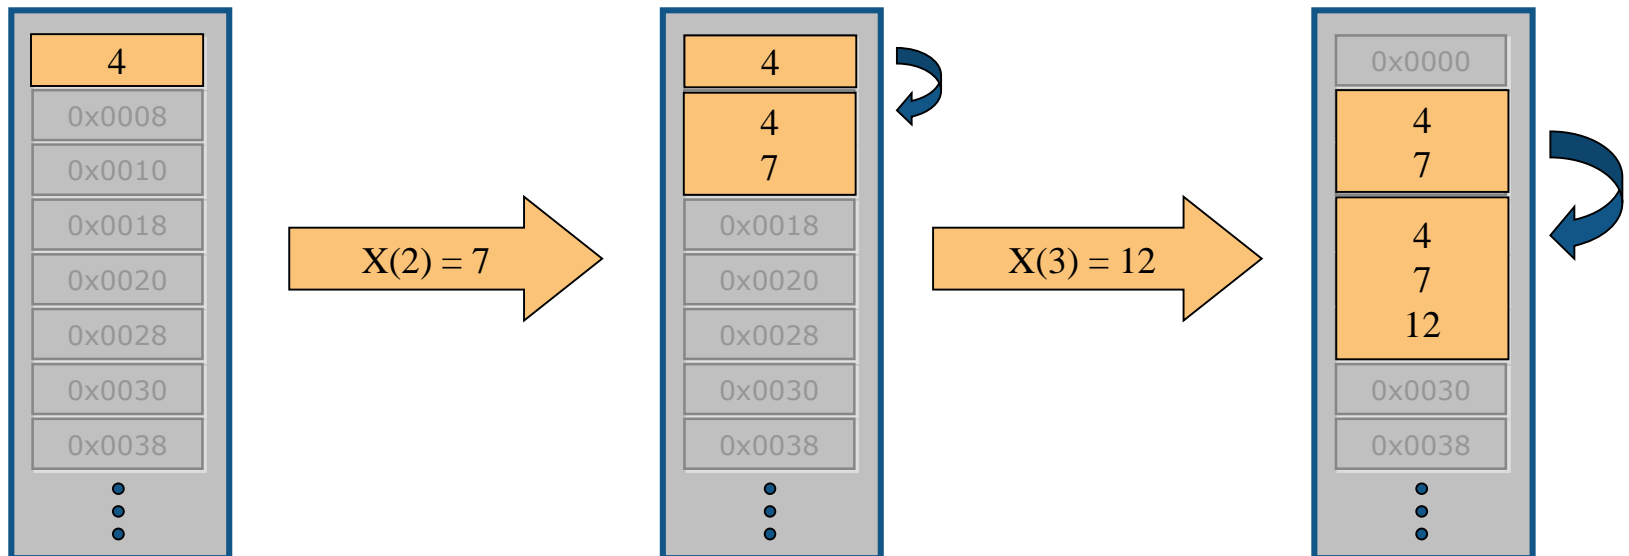

Effect of Not Preallocating Memory

x = 4

x(2) = 7

x(3) = 12

**Resizing
Arrays is
Expensive**

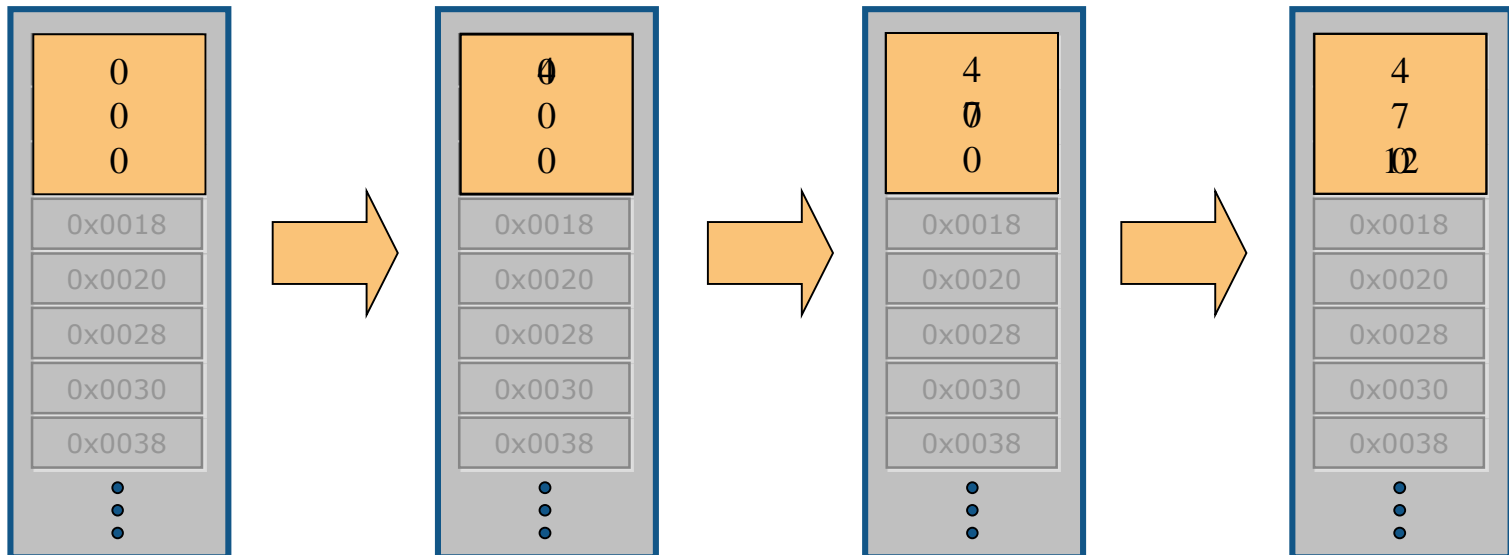

Benefit of Preallocation

```
x = zeros(3,1)
```

```
x(1) = 4
```

```
x(2) = 7
```

```
x(3) = 12
```

Benefit of Preallocation

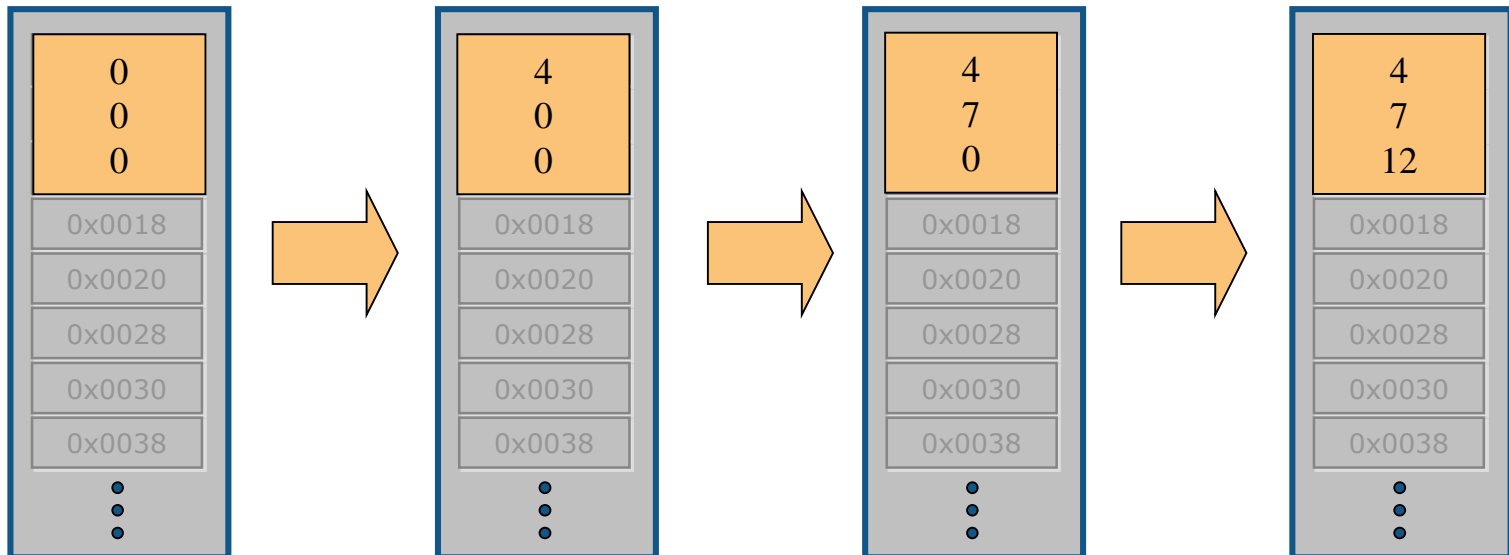

```
x = zeros(3,1)
```

```
x(1) = 4
```

```
x(2) = 7
```

```
x(3) = 12
```

**Reduced
Memory
Operations**

MATLAB Underlying Technologies

- Commercial libraries
 - BLAS: Basic Linear Algebra Subroutines (multithreaded)
 - LAPACK: Linear Algebra Package
 - etc.

**BLAS and LAPACK
require contiguous
arrays**

MATLAB Underlying Technologies

- JIT/Accelerator
 - Improves looping
 - Generates on-the-fly multithreaded code
 - Continually improving

Summary of Example: Tools

- Used built-in timing functions: `tic`, `toc`

```
>> tic; v = eig(rand(1000)); toc  
Elapsed time is 1.033879 seconds.  
>>
```

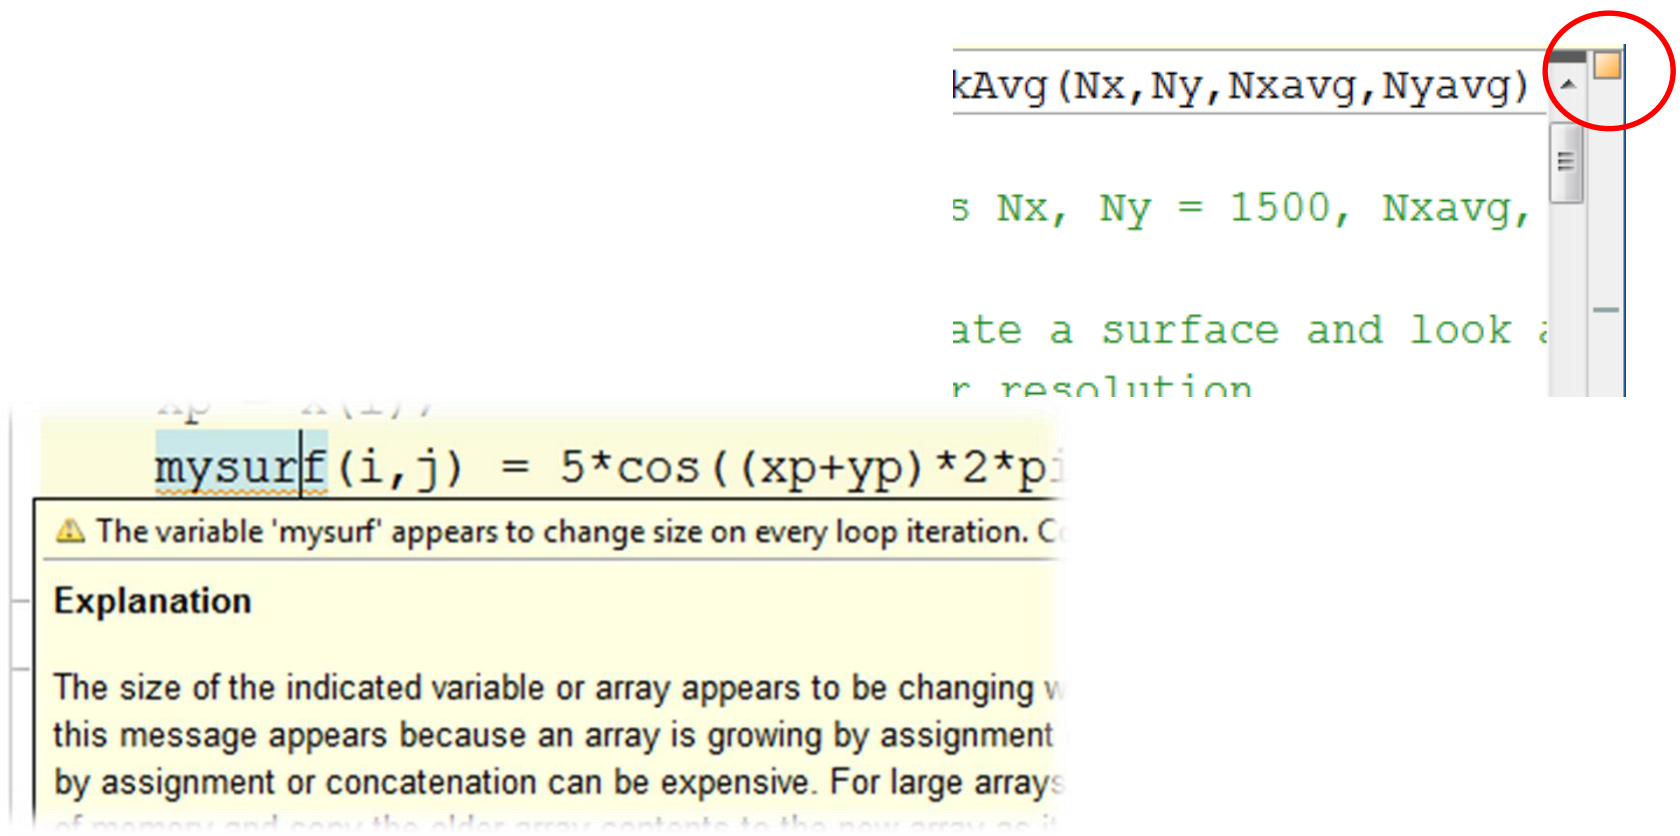

Summary of Example: Tools

- Used built-in timing functions: `timeit`

```
>> t = timeit(@()svd(rand(1000)))  
t =  
    0.4190  
>> |
```

Summary of Example: Tools

- Used Code Analyzer to find suboptimal code

The screenshot shows the MATLAB Code Analyzer interface. A red circle highlights the 'Show Details' button (a small square with a plus sign) in the top right corner of the warning panel. The warning panel displays the following code snippet:

```

kAvg (Nx, Ny, Nxavg, Nyavg)

s Nx, Ny = 1500, Nxavg,

ate a surface and look a

r resolution

mysurf(i,j) = 5*cos((xp+yp)*2*pi)

```

Below the code snippet, a warning message is displayed:

⚠ The variable 'mysurf' appears to change size on every loop iteration. Consider preallocating the array.

Explanation

The size of the indicated variable or array appears to be changing within the loop. This message appears because an array is growing by assignment. Growing an array by assignment or concatenation can be expensive. For large arrays, it is more efficient to preallocate the array and then fill it with data.

Summary of Example: Techniques

- Preallocated arrays

```
>> x = zeros(3,1)
```

Summary of Example: Techniques

- Vectorized code

```
- %% Setting up values of surface on grid

% Precomputation of inputs
[ygrid,xgrid] = meshgrid(y,x);

mysurf = 5*cos((xgrid+ygrid)*2*pi)+...
        2*sin(xgrid*2*pi)+2*cos(xgrid*2*pi);
```

Other Best Practices

- Minimize dynamically changing path

```
>> cd (...)
```

Other Best Practices

- Minimize dynamically changing path

`>> cd (X)`

instead use:

`>> addpath (...)`

`>> fullfile (...)`

Other Best Practices

- Use the functional load syntax

```
>> load('myvars.mat')
```

Other Best Practices

- Use the functional load syntax

```
>> loadX('myvars.mat')
```

instead use:

```
>> x = load('myvars.mat')
```

```
x =
```

```
    a:  5
```

```
    b: 'hello'
```

Other Best Practices

- Minimize changing variable class

```
>> x = 1;
```

```
>> x = 'hello';
```

Other Best Practices

- Minimize changing variable class

```
>> x = 1;
```

```
>> x = 'hello';
```

instead use:

```
>> x = 1;
```

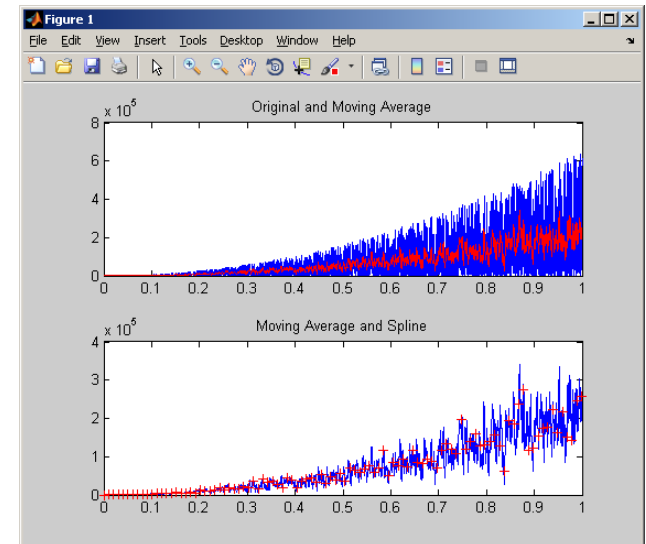

```
>> xnew = 'hello';
```

Agenda

- Leveraging the power of vector and matrix operations
- Addressing bottlenecks
- Generating and incorporating C code
- Utilizing additional processing power
- Summary

Example: Fitting Data

- Load data from multiple files
- Extract a specific test
- Fit a spline to the data
- Write results to Microsoft Excel

Summary of Example: Tools

- Profiler
 - Total number of function calls
 - Time per function call

Parents (calling functions)
No parent

Lines where the most time was spent

| Line Number | Code | Calls | Total Time | % Time | Time Plot |
|--------------------|---|-------|------------|--------|-----------------------------------|
| 79 | <code>xlswrite(fullfile('PlotFigs...', splineTi...</code> | 10 | 11.638 s | 66.2% | <div style="width: 66.2%;"></div> |
| 37 | <code>textscan(fid, '%*f %*f \n', nTi...</code> | 590 | 2.642 s | 15.0% | <div style="width: 15.0%;"></div> |
| 74 | <code>saveas(gcf, fullfile('PlotFigs...', 'splineTi...</code> | 10 | 2.115 s | 12.0% | <div style="width: 12.0%;"></div> |
| 58 | <code>figure;</code> | 10 | 0.526 s | 3.0% | <div style="width: 3.0%;"></div> |
| 28 | <code>nTimes = textscan(fid, '%s', 1);</code> | 10 | 0.191 s | 1.1% | <div style="width: 1.1%;"></div> |
| All other lines | | | 0.481 s | 2.7% | <div style="width: 2.7%;"></div> |
| Totals | | | 17.592 s | 100% | |

Children (called functions)

| Function Name | Function Type | Calls | Total Time | % Time | Time Plot |
|--------------------------|---------------|-------|------------|--------|-----------------------------------|
| xlswrite | function | 10 | 11.638 s | 66.2% | <div style="width: 66.2%;"></div> |
| saveas | function | 10 | 2.114 s | 12.0% | <div style="width: 12.0%;"></div> |
| newplot | function | 40 | 0.069 s | 0.4% | |
| subplot | function | 20 | 0.054 s | 0.3% | |

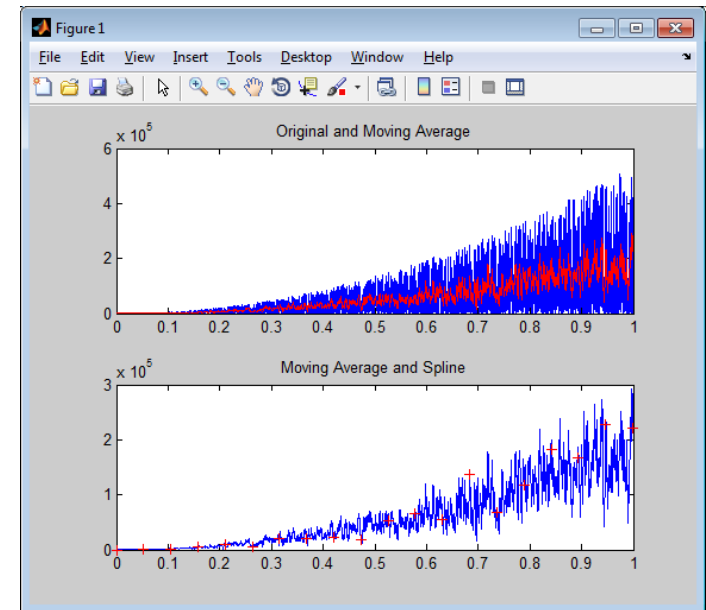

Summary of Example: Techniques

- Target significant bottlenecks
 - Reduce file I/O
 - Disk is slow compared to RAM
 - When possible, use **load** and **save** commands

Summary of Example: Techniques

- Target significant bottlenecks
 - Reuse figure
 - Avoid printing to command window

| Command Window | | | | |
|----------------|--------|--------|--------|------|
| 0.6010 | 0.8987 | 0.3676 | 0.4792 | 0.87 |
| 0.1969 | 0.5906 | 0.0684 | 0.0408 | 0.73 |
| 0.7029 | 0.1359 | 0.0803 | 0.1856 | 0.44 |
| 0.9487 | 0.1377 | 0.9798 | 0.1154 | 0.89 |
| 0.9230 | 0.1091 | 0.6545 | 0.3363 | 0.90 |
| 0.7524 | 0.1111 | 0.0034 | 0.5273 | 0.07 |
| 0.3987 | 0.1840 | 0.0568 | 0.6562 | 0.24 |

Steps for Improving Performance

- First focus on getting your code working
- Then speed up the code within core MATLAB
- Consider other languages (i.e. C or Fortran MEX files) and additional processing power

Agenda

- Leveraging the power of vector and matrix operations
- Addressing bottlenecks
- Generating and incorporating C code
- Utilizing additional processing power
- Summary

Why engineers and scientists translate MATLAB to C today?

Integrate MATLAB algorithms w/ existing C environment using source code and static/dynamic libraries

Prototype MATLAB algorithms on desktops as standalone executables

Accelerate user-written MATLAB algorithms

Implement C code on processors or hand-off to software engineers

Challenges with Manual Translation

from MATLAB to C

- Separate functional and implementation specification
 - Leads to multiple implementations that are inconsistent
 - Hard to modify requirements during development
 - Difficult to keep reference MATLAB code and C code in-sync

Challenges with Manual Translation

from MATLAB to C

- Manual coding errors

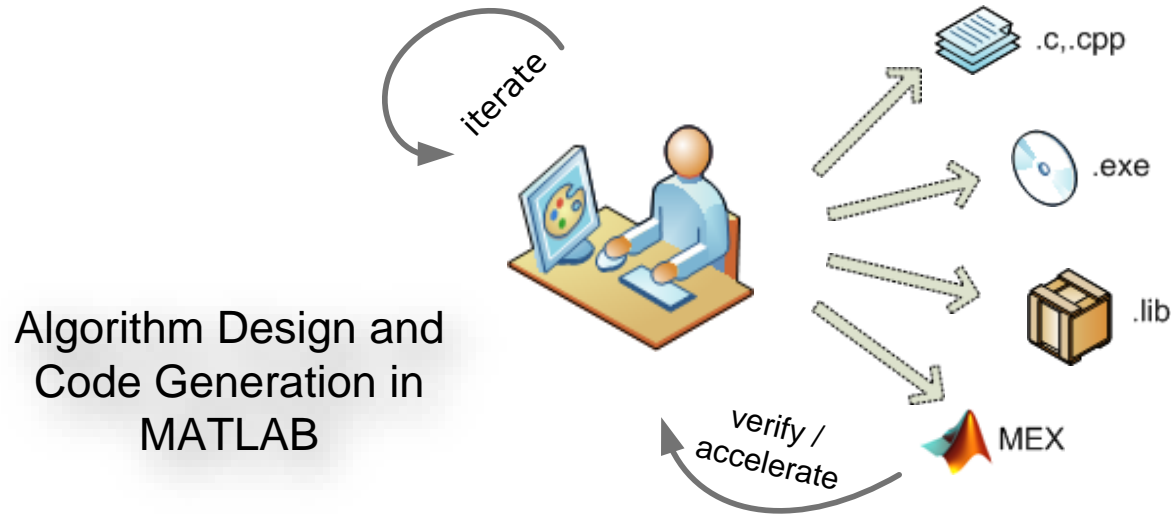

Challenges with Manual Translation

from MATLAB to C

- Time consuming and expensive

Automatic Translation of MATLAB to C

With MATLAB Coder, design engineers can

- Maintain one design in MATLAB
- Design faster and get to C quickly
- Test more systematically and frequently
- Spend more time improving algorithms in MATLAB

Acceleration using MEX

- Speed-up factor will vary
- When you **may** see a speedup
 - Often for Communications and Signal Processing
 - Always for Fixed-point
 - Likely for loops with states or when vectorization isn't possible
- When you **may not** see a speedup
 - MATLAB implicitly multithreads computation
 - Built-functions call IPP or BLAS libraries

Supported MATLAB Language Features and Functions

| Matrices and Arrays | Data Types | Programming Constructs | Functions |
|---|--|--|---|
| <ul style="list-style-type: none"> • Matrix operations • N-dimensional arrays • Subscripting • Frames • Persistent variables • Global variables | <ul style="list-style-type: none"> • Complex numbers • Integer math • Double/single-precision • Fixed-point arithmetic • Characters • Structures • Numeric class • Variable-sized data • MATLAB Classes • System objects | <ul style="list-style-type: none"> • Arithmetic, relational, and logical operators • Program control (if, for, while, switch) | <ul style="list-style-type: none"> • MATLAB functions and sub-functions • Variable length argument lists • Function handles <p>Supported algorithms</p> <ul style="list-style-type: none"> • > 800 MATLAB operators and functions • > 200 System objects for <ul style="list-style-type: none"> • Signal processing • Communications • Computer vision |

Agenda

- Leveraging the power of vector and matrix operations
- Addressing bottlenecks
- Generating and incorporating C code
- Utilizing additional processing power
- Summary

Going Beyond Serial MATLAB Applications

Parallel Computing enables you to ...

Larger Compute Pool

Speed up Computations

Larger Memory Pool

Work with Large Data

Parallel Computing on the Desktop

- Speed up parallel applications on local computer
- Take full advantage of desktop power by using CPUs and GPUs
- Separate computer cluster not required

Using Additional Cores/Processors (CPUs)

Ease of Use

- Support built into Toolboxes

Greater Control

Tools Providing Parallel Computing Support

- Optimization Toolbox
- Global Optimization Toolbox
- Statistics Toolbox
- Communications System Toolbox
- Simulink Design Optimization
- Bioinformatics Toolbox
- Image Processing Toolbox
- ...

Directly leverage functions in Parallel Computing Toolbox

<http://www.mathworks.com/products/parallel-computing/builtin-parallel-support.html>

Using Additional Cores/Processors (CPUs)

Ease of Use

- Support built into Toolboxes
- Simple programming constructs:
`parfor`, `batch`, `distributed`

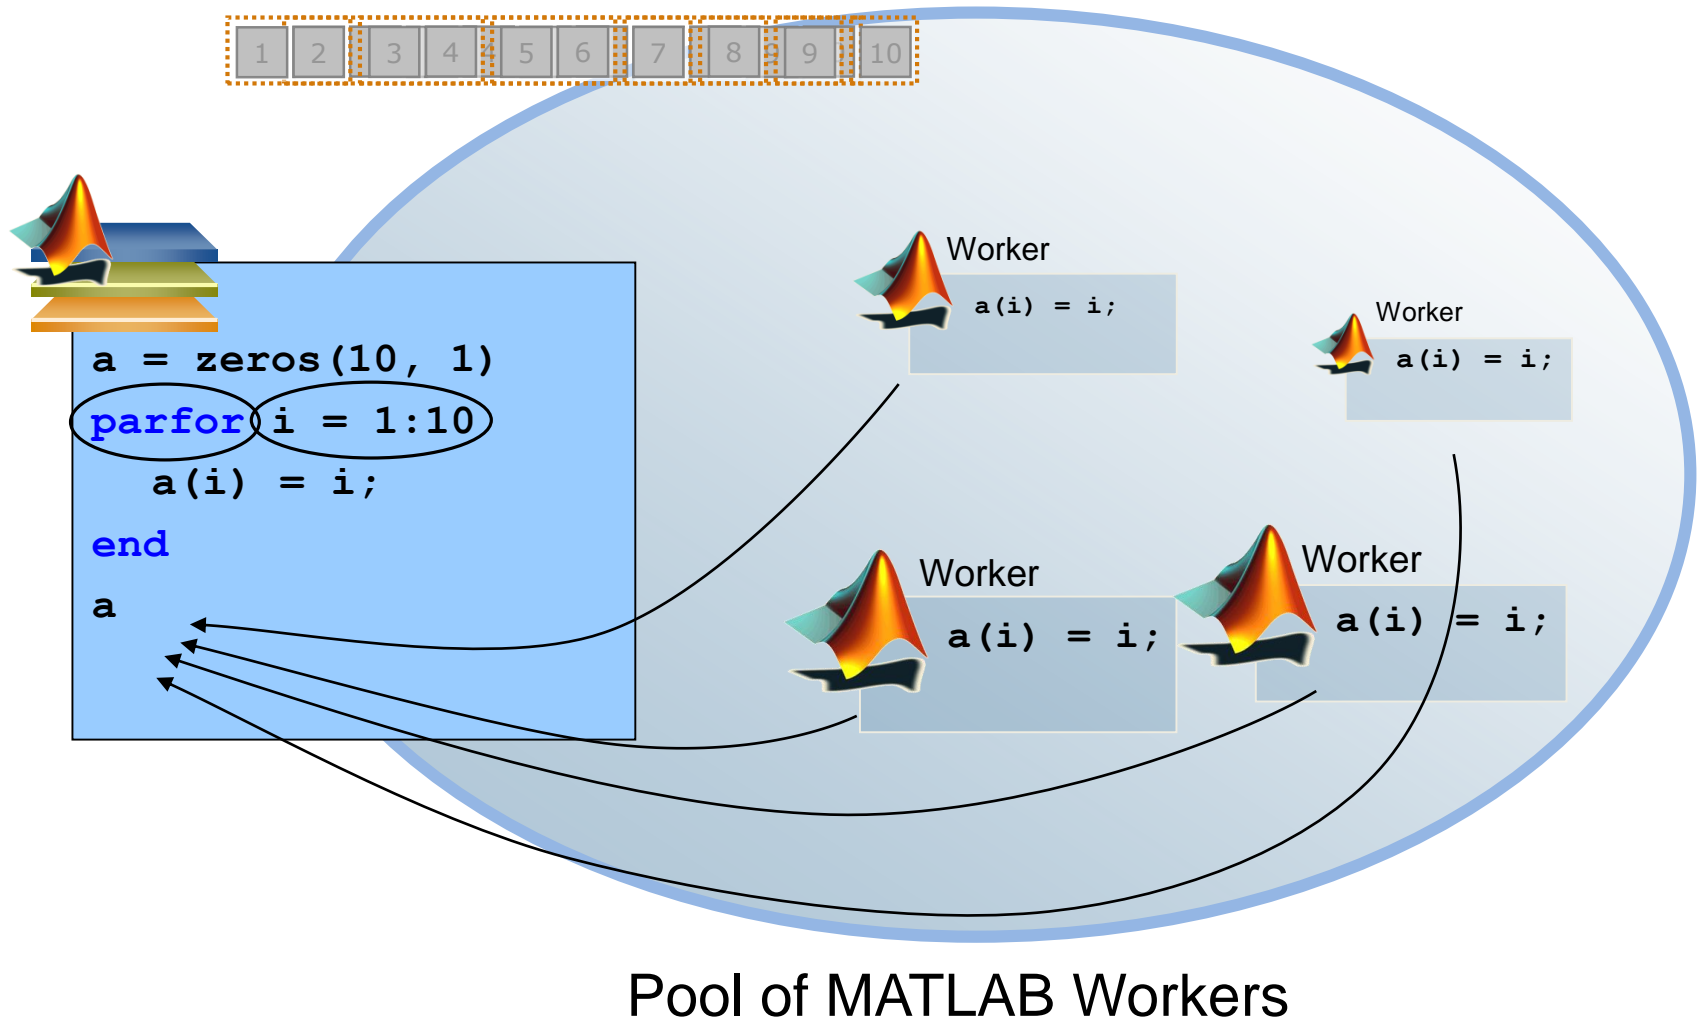

Greater Control

Running Independent Tasks or Iterations

- Ideal problem for parallel computing
- No dependencies or communications between tasks
- Examples include parameter sweeps and Monte Carlo simulations

The Mechanics of parfor Loops

Example: Parameter Sweep of ODEs

Parallel for-loops

- Parameter sweep of ODEs
 - Deflection of a truss under a dynamic load

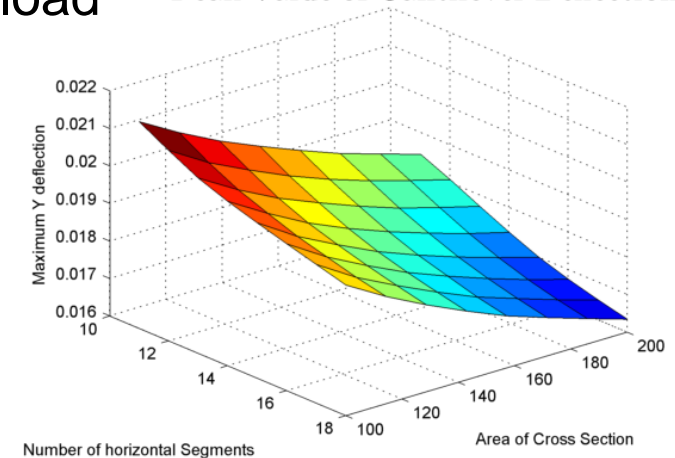

$$M\ddot{x} + C\dot{x} + Kx = F$$

Example: Parameter Sweep of ODEs

Parallel for-loops

- Parameter sweep of ODEs
 - Deflection of a truss under a dynamic load
 - Sweeping two parameters:
 - Number of truss elements
 - Cross sectional area of truss elements

Peak Value of Cantilever Deflection

$$M\ddot{x} + C\dot{x} + Kx = F$$

Using Additional Cores/Processors (CPUs)

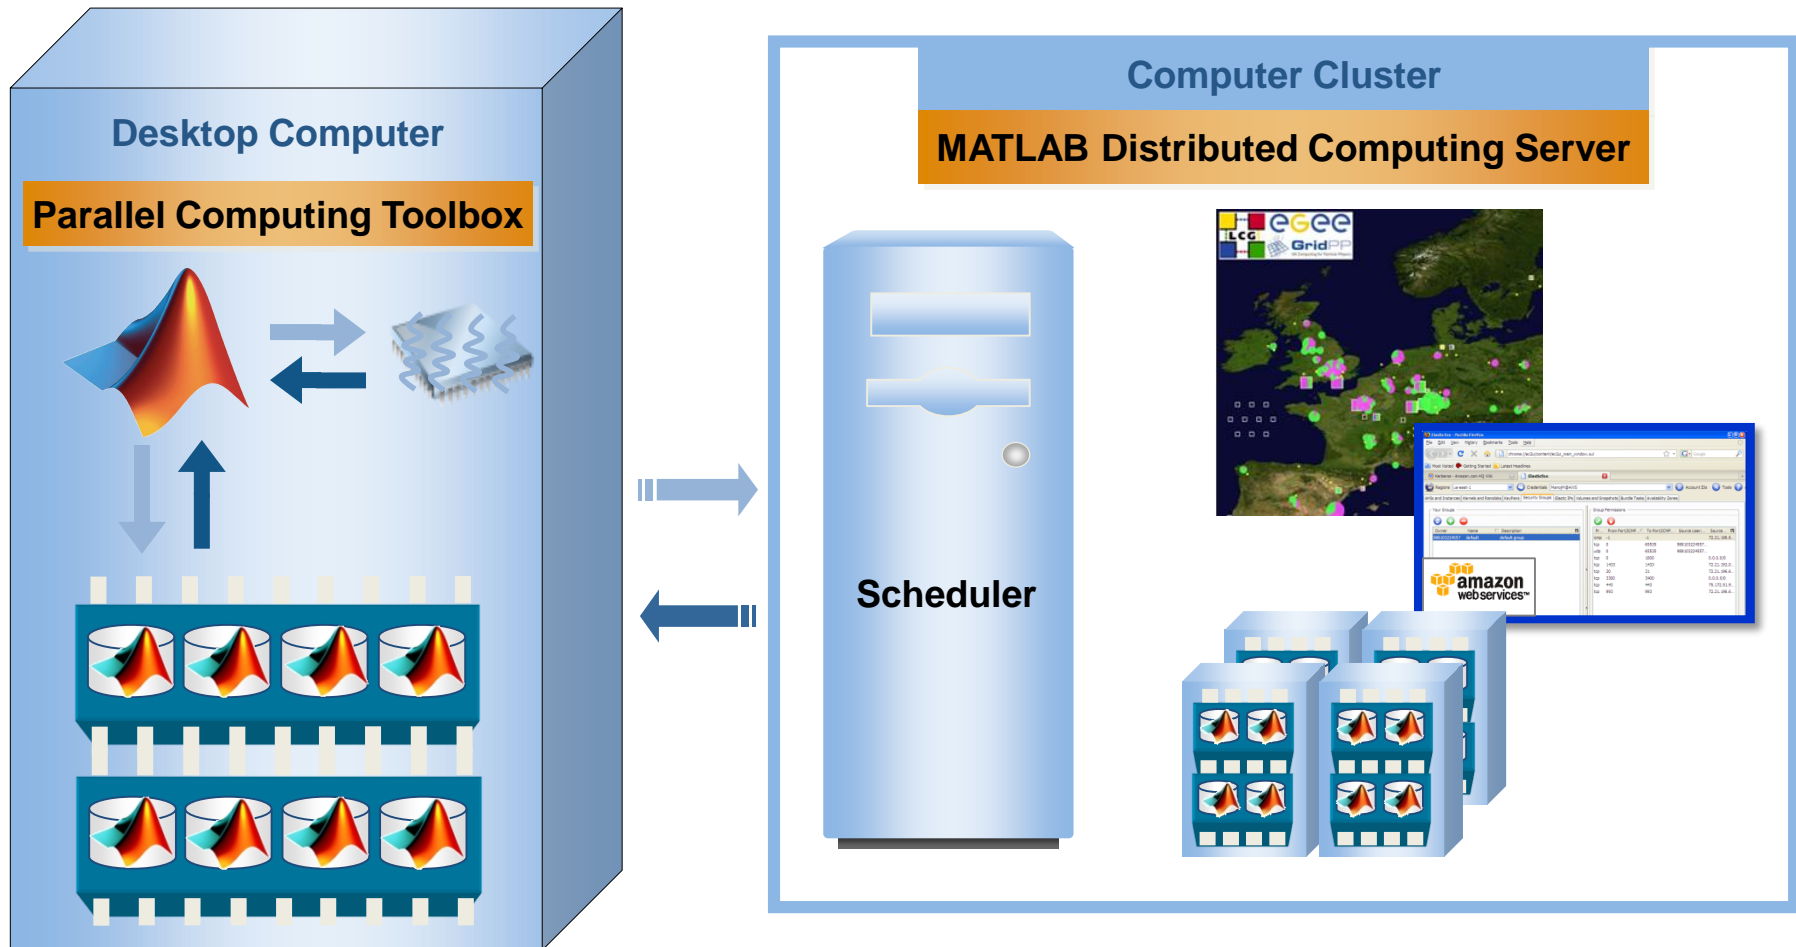

Ease of Use

- Support built into Toolboxes
- Simple programming constructs:
`parfor`, `batch`, `distributed`
- Full control of parallelization:
jobs and tasks, `spmd`

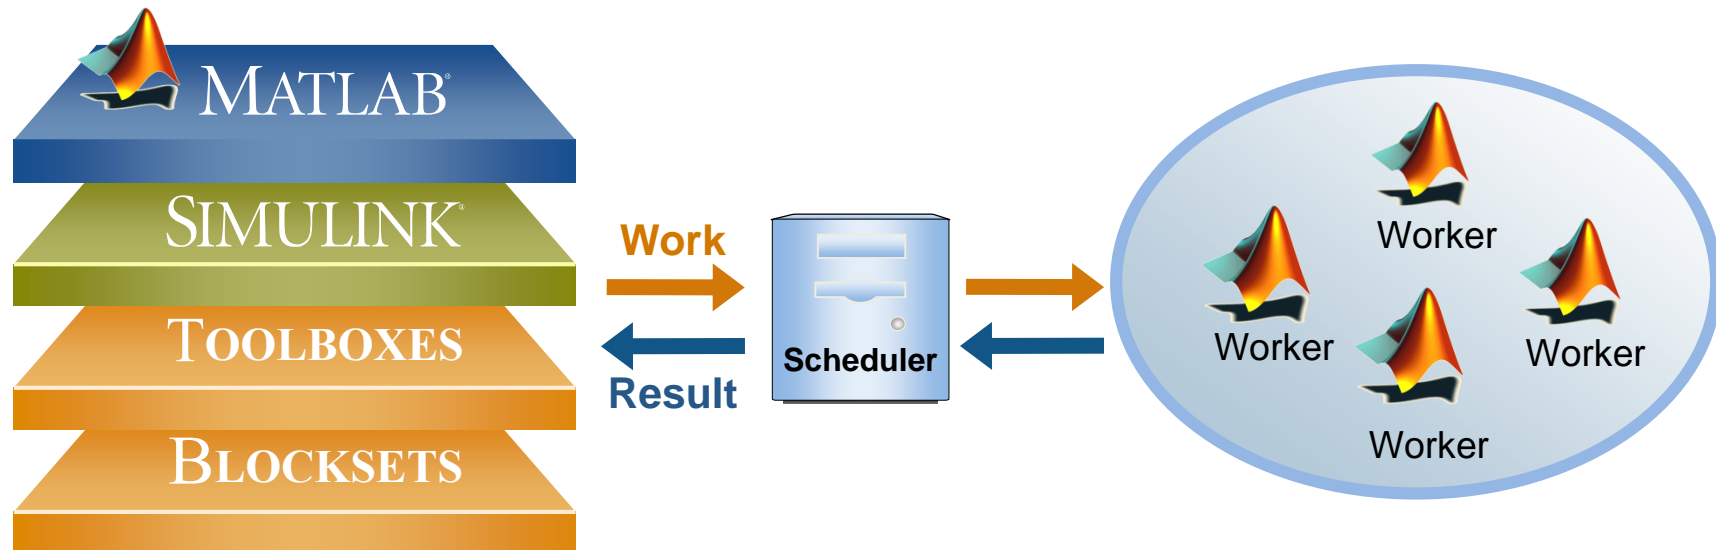

Greater Control

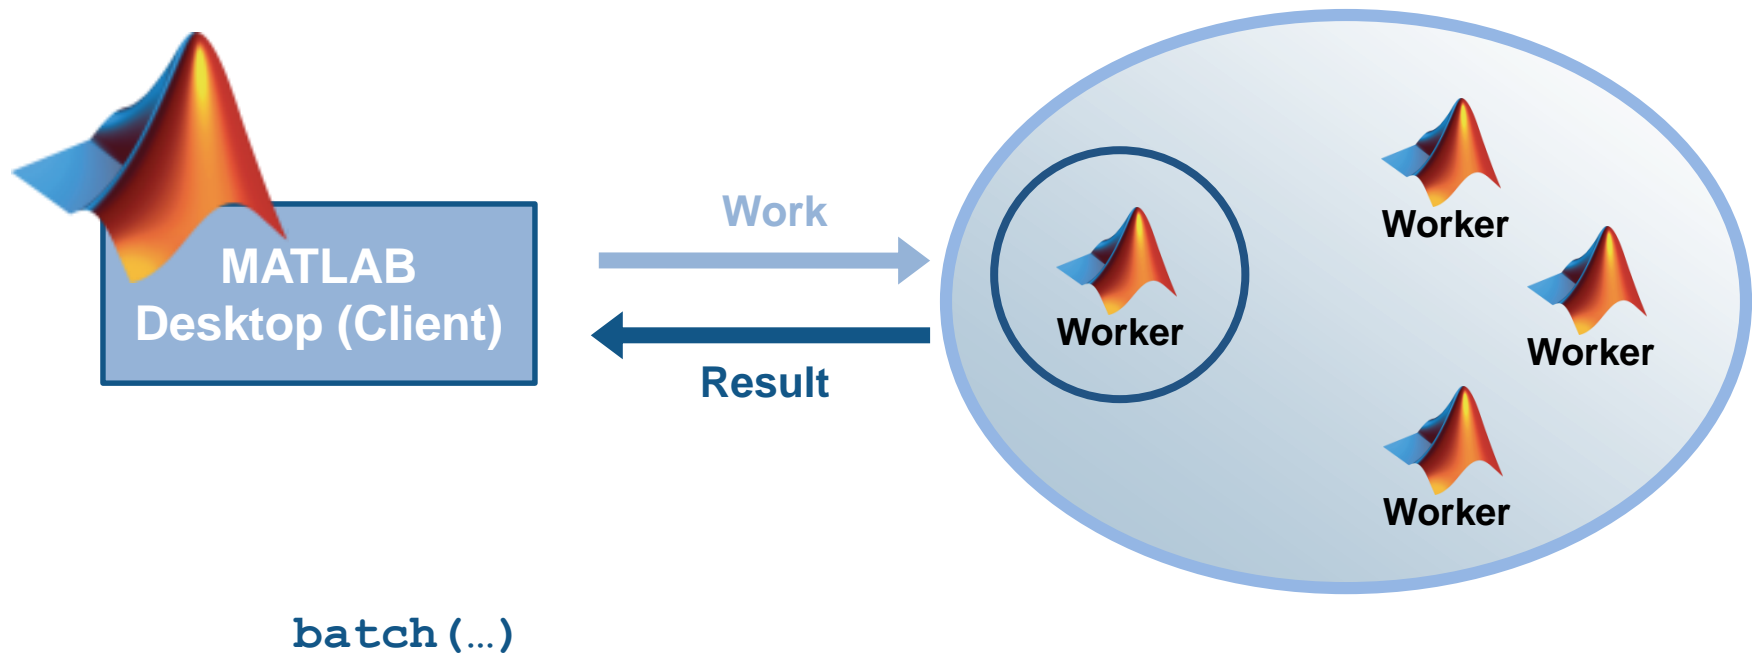

Scale Up to Clusters, Grids and Clouds

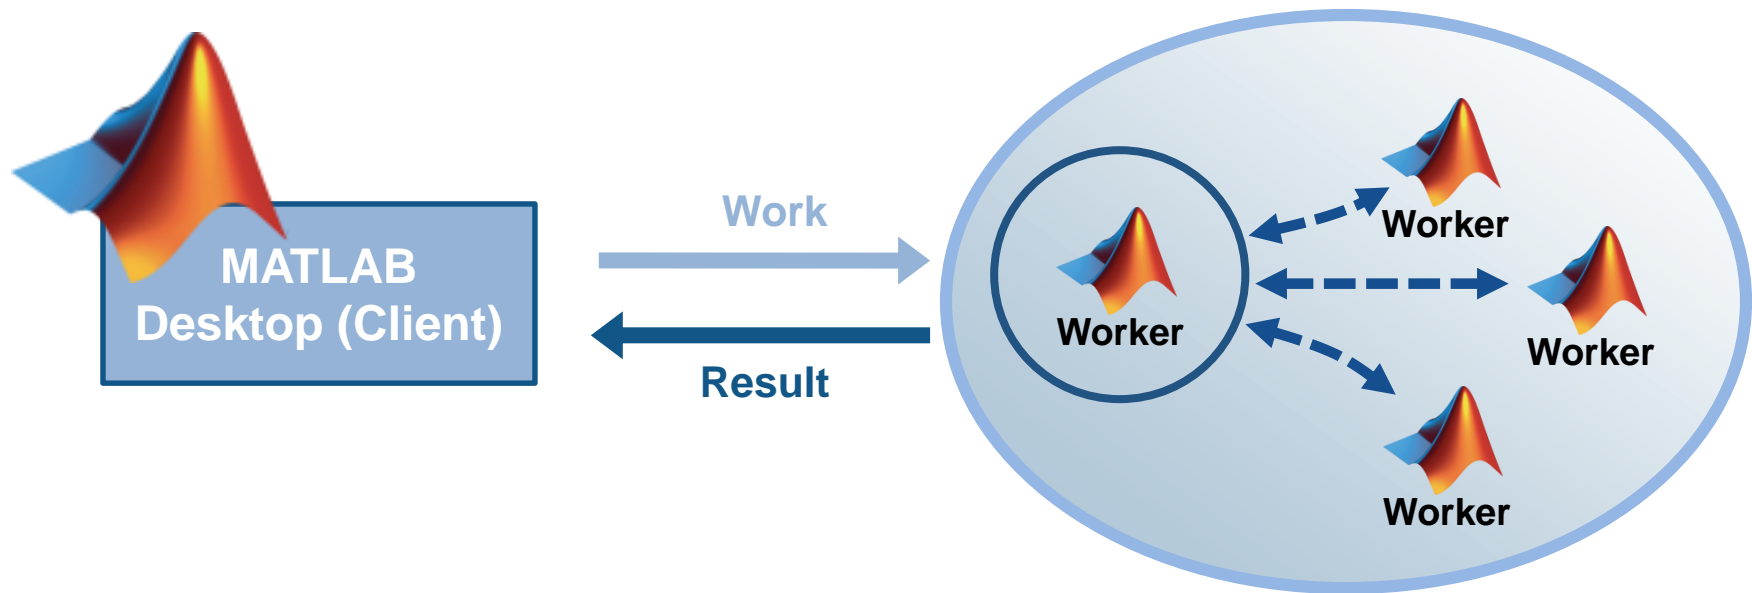

Scheduling Work

Offload Computations with batch

Offload and Scale Computations with batch

`batch(..., 'Pool', ...)`

What is a Graphics Processing Unit (GPU)

- Originally for graphics acceleration, now also used for scientific calculations
- Massively parallel array of integer and floating point processors
 - Typically hundreds of processors per card
 - GPU cores complement CPU cores
- Dedicated high-speed memory

Performance Gain with More Hardware

Using More Cores (CPUs)

Using GPUs

GPU Requirements

- Parallel Computing Toolbox requires NVIDIA GPUs
- This includes the Tesla 20-series products

| MATLAB Release | Required Compute Capability |
|------------------------------------|-----------------------------|
| MATLAB R2014b | 2.0 or greater |
| MATLAB R2014a and earlier releases | 1.3 or greater |

See a complete listing at www.nvidia.com/object/cuda_gpus.html

Programming Parallel Applications (GPU)

Ease of Use

- Built-in support with toolboxes

Greater Control

Programming Parallel Applications (GPU)

Ease of Use

- Built-in support with toolboxes
- Simple programming constructs:
`gpuArray`, `gather`

Greater Control

Example: Solving 2D Wave Equation

Solution of 2nd Order Wave Equation

- Solve 2nd order wave equation using spectral methods:

$$\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2}$$

Benchmark: Solving 2D Wave Equation

CPU v. GPU

Intel Xeon Processor W3550 (3.07GHz), NVIDIA Tesla K20c GPU

Programming Parallel Applications (GPU)

Ease of Use

- Built-in support with toolboxes
- Simple programming constructs:
`gpuArray`, `gather`
- Advanced programming constructs:
`arrayfun`, `spmd`
- Interface for experts:
`CUDAKernel`, `MEX` support

Greater Control

Agenda

- Leveraging the power of vector and matrix operations
 - Addressing bottlenecks
 - Generating and incorporating C code
 - Utilizing additional processing power
- Summary

Key Takeaways

- Consider performance benefit of vector and matrix operations in MATLAB
- Analyze your code for bottlenecks and address most critical items
- Leverage MATLAB Coder to speed up applications through generated C/C++ code
- Leverage parallel computing tools to take advantage of additional computing resources
